Twin N on Irrigated Wheat Trial – Kenya

Grower: Dave Jenkins farm beyond Mpongwe, Kenya 2007

Grower's notes: The green area illustrated along the base line of the pivot is an approx. area of 15 ha of a 100ha field that was sprayed with Twin N.

Basal and top dressing applications throughout the field were exactly the same, however the bigger red area in the middle of the field was sprayed with Organocell & Omniboost from area and the control area along the curve of the pivot had no foliar sprays at all.

Results A small area was highlighted on the yield map from each area and average results were:

Twin N: 9.860t/ha, Organocell/Omniboost:7.781t/ha, Control: 7.163t/ha

Twin N increased yield by 2.7 tonne / ha over usual basal nitrogen application, contributing greater than 90 units of nitrogen to the crop.
